Question **1**

Correct

A year Y will be passed as input. The program must find if the given year is a leap year or not.

- If it is leap year, the program must print yes else it should print no

**Note:** A year is a leap year if it is divisible by 4. If it is a century, then it should be divisible by 400.

The **pseudocode** is as given below:

if year is divisible by 400 then is\_leap\_year

else if year is divisible by 100 then not\_leap\_year

else if year is divisible by 4 then is\_leap\_year

else not\_leap\_year

**Example Input/Output:**

If 2000 is the input, the program must print yes

If 2100 is the input, the program must print no

If 2013 is the input, the program must print no

**Input Format:**

A year as a number is passed to the standard input.

**Output Format:**

The string value as per the conditions above printed to the standard output.

**Boundary Conditions:**

$0 < Y \leq 8000$

Input:

1980

Expected Output:

yes

**For example:**

Input	Result
1980	yes

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main()
3 {
4     int y;
5     scanf("%d",&y);
6     if((y%400==0) || (y%4==0&&(y%100!=0)))
7         printf("yes\n");
8     else
9         printf("no\n");
10    return 0;
11 }
```

	Input	Expected	Got	
✓	1980	yes	yes	✓

Passed all tests! ✓

Question **2**

Correct

An expression E is passed as an input to the program. The expression will contain three numbers A, B and C, one equal symbol and one of the mathematical operators + - \* /

But the given mathematical operator is incorrect and hence the expression is not valid. Hence the program must identify the correct operator and print that as the output.

**Input Format:**

First line will contain the expression E

**Output Format:**

First line will contain the correct mathematical operator

**Sample Input/Output:****Example 1:**

Input:

5-4=20

Output:

\*

Explanation:

Only 5 multiplied with 4 gives 20. Hence - must be replaced with \*.

**Example 2:**

Input:

999+9=111

Output:

/

Explanation:

Only 999 divided by 9 gives 111. Hence + must be replaced with /.

**For example:**

Input	Result
5-4=20	*
999+9=111	/

**Answer:** (penalty regime: 0 %)

```

1  #include<stdio.h>
2  int main()
3  {
4      int a,b,c;
5      char op;
6      scanf("%d %c %d=%d",&a,&op,&b,&c);
7      if(a+b==c)
8          printf("+\n");
9      else if(a-b==c)
10         printf("-\n");
11     else if(a*b==c)
12         printf("*\n");
13     else if(b!=0&&a/b==c)
14         printf("/\n");
15     return 0;
16 }
```

	Input	Expected	Got	
✓	5-4=20	*	*	✓
✓	999+9=111	/	/	✓

Passed all tests! ✓
